

SH-CMF-Coriolis Mass Flow Meters

Principle

The structure of Coriolis Mass Flow Meters was consisted of a pair of bended tubes. The principle is to detect Coriolis force which is forced on a pair of tubes from inner mass flow by fluid.

A new force-Coriolis force would be appearing while two conditions are met:

- a. Vibrating with normal frequency in a pair of bended tubes,
- b. Fluid flowing in tubes. This force was produced upon synthesis from vibrating force and flowing force by fluid in tubes. And tubes would be wresting symmetric the center line because the force forced.

Two displacement sensors on sides of tubes detect the force and output electric signals.

The signals regulated and mass flow directly produced.
